

Mr. McClure prepared his next class' lesson. Mark Roe worked hard on his homework, and Herschel

Riggle and Don Porter had a good laugh. All this took place in an average study hall.

MATH DEPARTMENT

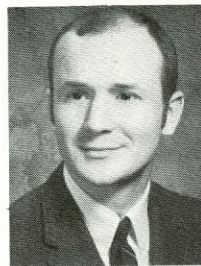

The age of the computer

The purpose of mathematics is to teach students practical problem-solving for everyday living.

Mathematics is the basis for most technology used in today's fast-paced, complex living. The average person uses it every time he attempts to conquer a problem, whether it's as simple as adding the price of penny candy or as complicated as asking a girl for a date.

Math is used in every aspect of labor--in measuring footage, in counting stock on a farm, or calculating distances. The world today progresses from the foundations created by mathematics and its related sciences.

Without our knowledge of complex mathematics, man would live in a primitive environment.
